

Design checklist

Each entry will be considered complete when it has a finalized visual reference. For environments, sketch out important features and consider how its VN background image might be composed.

Characters

Name	Notes
LFTR-03-251	The main character of the story. An old, outdated model of LFTR robot, a humanoid robot with generalized hard labor skills. Her outer plating has dulled over many long years of service, and she has a patchwork body of improvised parts due to numerous replacements over the years.
Eris Promethea	Genius inventor, futurist, and owner of Daedalus Robotics, one of the most wealthy and powerful corporations in the solar system. She has a calm demeanor and dresses semi-formally, exhibiting an elegant but practical style. Consider appearances for different occasions: when she is out traveling on business, and when she is working in the lab.
LFTR model 08	A more recent, but still not cutting-edge model of LFTR robot. Should look like a natural evolution of the earlier model.
ADMN model 04	Another class of robot designed for administrative tasks rather than labor. Need not be humanoid in shape. Interfaces with computer systems, handles logistical tasks, performs planning duties, and oversees the labor of other robots.
SYNC model 01	A brand new model of bio-mechanical robot chassis. Its limbs proudly display artificially-grown muscle fibers, but they are incorporated into a sleek and elegant metal frame to avoid appearing grotesque. Should look futuristic and cutting-edge, but still capable of hard labor.
Daedalus security	Uniformed human security guards that work for Daedalus HQ. Consider giving them helmets or masks to obscure the face, since they will not be heavily characterized or have much dialogue.

Environments

Name	Notes
Keres Shipyard	A deep space shipyard orbiting an icy moon of Saturn. In a remote location and not often visited by humans; it does not need to look pretty or organized. Most of its facilities are outside, exposed to the vastness of space, since its robot workforce can operate there with no issues. Some docks sit empty, others are filled with ships in various states of repair. Contains chambers both for labor robots to spend their downtime and for human visitors to speak with the robot staff.
Keres Shipyard director's office	The office belonging to the administrative head of Keres Shipyard. Eris brings 251 there to discuss her plans.
Elysium	A floating, domed city in the skies of Saturn. A utopic city of luxury. 251 gets a brief look at the city as Eris takes her to Daedalus HQ.
Halls of Daedalus HQ	An opulent building designed like a palace, where Daedalus Robotics keeps its head offices. Eris and 251 traverse these halls to reach various parts of the building.
Eris's bedroom	Eris's personal chambers. 251 is allowed to share a bed with Eris, and they spend lots of personal time here. The room looks like a museum, and is decorated with aesthetically appealing display pieces, including the prototype SYNC model 01 in a glass display case.
Eris's laboratory	A messy lab full of advanced equipment where Eris spends most of her time. Prominently features a large table where 251 lies down while Eris opens up her chassis and performs maintenance.
